

# Healthier and Longer Lives

## How old is your pet in human years?

Well an approximate example is a 1-year-old dog or cat is 15 in our years. Each year the number of human years in relation decreases, so do not panic, you won't have a 10-year-old pet that is 150 human years old! Even though ageing is inevitable, always remember there is so much we can do to keep your pets healthy and enjoying a good quality of life as they become older. A combination of regular exercise, preventative healthcare, a good diet, along with the ever-increasing advancement of medical and surgical care, can help your pets live much healthier and longer lives.

## Blood Screening Profile

A busy river of red liquid flows through your pet's body distributing oxygen and nutrients, fighting infections and collecting waste. **Blood** carries a wealth of information about your pet's health. Here at our surgery, we can do a full blood screening profile to help detect signs of disease and organ dysfunction. There are many conditions and problems that can be diagnosed in the earlier stages, which provides an improved start in treatment to help your pet enjoy a healthier life.

The process is almost the same as for humans and is generally quick and simple. For our furry pets though, we shave a little of their hair, then a fine needle is inserted into a vein from where a small amount of blood is taken. A nurse will hold and reassure your pet during the process.

## Identify-Diagnose-Treat

The blood screening profile is done in-house using advanced diagnostic equipment to provide rapid results. If the test shows that your pet is developing a condition of any kind, your vet can discuss with you the many forms of treatment that modern veterinary medicine now provides. Not all conditions can be cured, but treatments can help to improve your pets' quality of life.

**If you are interested in a blood screening profile for your pet, please contact us for further information.**

Veterinary medicine has advanced greatly over the years, and now enables us to treat and diagnose a wide range of conditions that may previously have been incurable. At times of accident and sudden illness, it can be reassuring for the owner to know their pet's treatment is covered by insurance.

**We endorse having your pet insured and are accredited as an Introducer Appointed Representative of Vetsure Pet Insurance®.**

Why we promote  
**vetsure**

**Trusted** - The Vetsure pet insurance range has been designed in close collaboration with vets to try to keep things as clear as possible. We work very closely with Vetsure to ensure that, should your pet require treatment, we will make the claims process as simple as possible.

**Simple** - Because we are a Vetsure accredited practice, all claims will be settled direct. This means at the time of treatment, simply pay the policy excess contribution and leave the rest to us!

**Tailored** - Choose from a range of benefits to suit you and your budget. You can further tailor your cover and choose between three excess levels. The higher the excess you choose, the lower the monthly premium. *Vetsure will only charge the excess ONCE per unrelated condition.*

**Lifelong** - Vetsure insurance policies aim to avoid the pitfalls so frequently experienced with other types of policies. Therefore, ALL Vetsure policies are 'lifelong', which means their policies provide cover for long-term and recurring conditions (*just be sure to renew your policy and keep your premiums up to date*).

**Get 5 Weeks Free\*!** - As a fully accredited Vetsure practice we can offer our clients 5 weeks cover free of charge. Simply choose whichever level of cover you are interested in taking out. If you're happy, your cover will continue seamlessly!

To activate your 5 Weeks Free\* cover call the friendly team at Vetsure on 0800 0502022.

\*You must contact Vetsure to activate your cover. Cover for accidents starts immediately once your free trial has been activated.

There is a 14 day 'waiting period' for illness conditions - meaning illness conditions occurring or showing clinical signs during this period will be excluded.

# Neutering your Feline Friend

Our hearts melt when we see those cute wide-eyed kittens, but did you know that within a few months, these little ones can actually produce babies of their own? However, there is the option to neuter your kitten, which has many health and social advantages for your pet.

**A Male Cat (Tom)** begins to mature at around 5 - 8 months old, and starts to spray strong smelling urine to mark and protect their territory. He will also roam in search of females in season, and on meeting other male cats will fight, which can cause major bites, torn ears, deep scratches and possible infection. There is the added risk of the potentially fatal Feline Immunodeficiency Virus (cat aids) and Feline Leukaemia Virus, which can be transmitted via bites and scratches.

**Neutering helps to:** ● reduce roaming ● spraying ● aggression ● fighting ● injury ● limit the spread of fatal disease ● stop unwanted litters of kittens

**Female Cat (Queen)** can begin their seasons and 'call' at approximately 6 months old, so although still a kitten, she will probably get pregnant! Seasons are every three weeks during the spring and summer months. She is capable of 2/3 litters each year of her life, with around 3/4 kittens (but can be more) in each litter. No sooner has she delivered her babies, she will then begin another season and try to get pregnant again! There is also the risk of fatal disease through close contact with unvaccinated males.

**Neutering will:** ● end seasons and calling ● prevent pregnancies ● stop unwanted litters of kittens ● help limit the spread of disease ● prevent womb infection and mammary tumours

**The Operation** Neutering is quite a routine procedure. Your pet will receive the best care possible here at our surgery. He or she will require an anaesthetic for the operation, and a nurse will monitor their breathing throughout the procedure. A female cat needs a few stitches and to be

kept indoors while the wound is healing. For a male there are no stitches, and he will generally be back to normal within a day or two, but it can take six weeks after the operation for the male to become infertile.

**If you would like to know more, please contact us.**

## PETS Passport Post Brexit

We were hoping to have provided more definite details with regard to Brexit and travelling to Europe with your pets. However, at the time of going to press, issues have still not been resolved!

If you are planning to travel to Europe with your pet, guidelines are to **allow at least 4 months before travel** to prepare your pet for their outbound and inbound journeys.

We therefore advise you to visit [www.gov.uk/guidance/pet-travel-to-europe-after-brexit](http://www.gov.uk/guidance/pet-travel-to-europe-after-brexit)

Here you will find current information on what course of action you should take, and as always, we will also endeavour to answer any queries you have.

## Fun in the Sun

Are you a new pet owner looking forward to the first summer with your friend? You can enjoy pleasant evening walks in the park with your dog, watch your cat relax on a shady terrace or your rabbits and guinea pigs frolic in their outdoor runs. After last year's scorcher, we urge **ALL pet owners** to be well prepared in case temperatures soar again.

**Heat NEVER** leave your pet in the car, not even with the windows open. **They will cook!**

**NEVER** leave your pets in closed conservatories, they reach oven-like temperatures!

Ensure your pets have access to fresh clean drinking water. Watch out for hot pavements or roads as dogs' pads can burn!

Take extra care with pets who have long/thick coats, are overweight, elderly, have breathing problems or a heart condition.

**Sun** Exercise your dogs in the cooler morning or evening air.

Regulate time in the sun and heat, as heatstroke/dehydration happens very quickly and can be fatal.

Sunblock the tips of white cats' ears and noses. Ask our team for details.

Provide access to shady, cooler areas in and outdoors.

**Gardens** Store and use all garden products carefully, as pets do sniff and eat strange items.

Stolen B-B-Q bones and corn husks can get lodged in the mouth, throat and stomach.

Bee and wasp stings can cause allergic reactions; some serious. Call us for advice if your pet is stung or you see swellings on their paws, face or mouth.

Provide shade for your guinea pig and rabbit runs, and place away from plants as some can be very poisonous to your pets if eaten.

Check rabbits' bottoms daily for flies and maggots. **Flystrike can sadly be fatal.**
